Update on Blades, Delaware – During the week of April 30, 2018, Region 3 will conduct the second round of private wells sampling necessary to confirm available information about the levels of PFAS compounds in private wells. Residential properties at which contaminant levels were at, above or within 75% of the Health Advisory Number (70 ppt) after the first round of sampling received carbon filters from Delaware Natural Resources and Environmental Control. Water samples after the filters were collected at those properties to confirm the filters were working. All post carbon sample results show no contamination in the water samples indicating that the filters are working as expected. (E. Rovira, 4-3436; K. Chase, 4-3124).
